

The Lightning Network

Machine-to-machine Payments

Leonhard A. Weese
President, Bitcoin Association of Hong Kong
leo@bitcoin.org.hk

Hong Kong, January 4, 2019

Bitcoin

Decentralized, open and free global financial network

- Slow (~10 min block intervals)
- Expensive (~HK\$2-30)
- Limited capacity (~4-7 tx/s)
- Volatile exchange rate (~2% per hour)

Blockchain

- Does not scale
- Broadcast model
- High **external costs** (Memory, bandwidth, computing power)
 - > Dangerous conflicts between throughput and decentralization

A New Network

- Bitcoin as the settlement layer
- Lightning as the payment layer
- Scaling without compromising the security of the base layer
- Lightning is not a Blockchain!

Bitcoin Transaction

2018-10-10 16:40

tx: hgb710f470dd3df348fc99fbf9c148b

from: fb9c6b8dad6094a9b7bf0438eb223e

to: 12CJg4sxZHgPLrVHxk7p7o4s5f286G9iim

amount: 12.5 Bitcoin signature: *Alice*

The Signatures of Alice and Bob are needed to spend these outputs

- Every transaction references a previous transaction
- Every transaction is signed
- Complicated rules can be defined
(→ **Smart Contracts**)

Payment Channel

2018-10-10 16:40

tx: `hgb710f470dd3df348fc99fbf9c148b`
from: `fb9c6b8dad6094a9b7bf0438eb223e`
to: `bc1qtnsyw9d78dnf9j8p2rhvbj2fx6ukmya6xqfcxl`
amount: 1 Bitcoin signature: ~~~

The Signatures of Alice and Bob are needed to spend these outputs

- 1) Payment Channel is being opened
1 BTC is sent to a 'multisig' address
Alice and Bob control this address **together**

Payment Channel

2018-10-10 16:40

tx: hgb710f470dd3df348fc99fbf9c148b
from: fb9c6b8dad6094a9b7bf0438eb223e
to: bc1qtnsyw9d78dnf9j8p2rhvbj2fx6ukmya6xqfcxl

amount: 1 Bitcoin signature: ~~~

The Signatures of Alice and Bob are needed to spend these outputs

2) Alice only signs her transaction after she receives Bob's signature on a refund transaction. This way her funds can't be stuck.

2018-10-10 16:40

tx: 283e4f581e1bb73d8d47a5072471f7
from: hgb710f470dd3df348fc99fbf9c148b

SETTLED

A Network of Channels

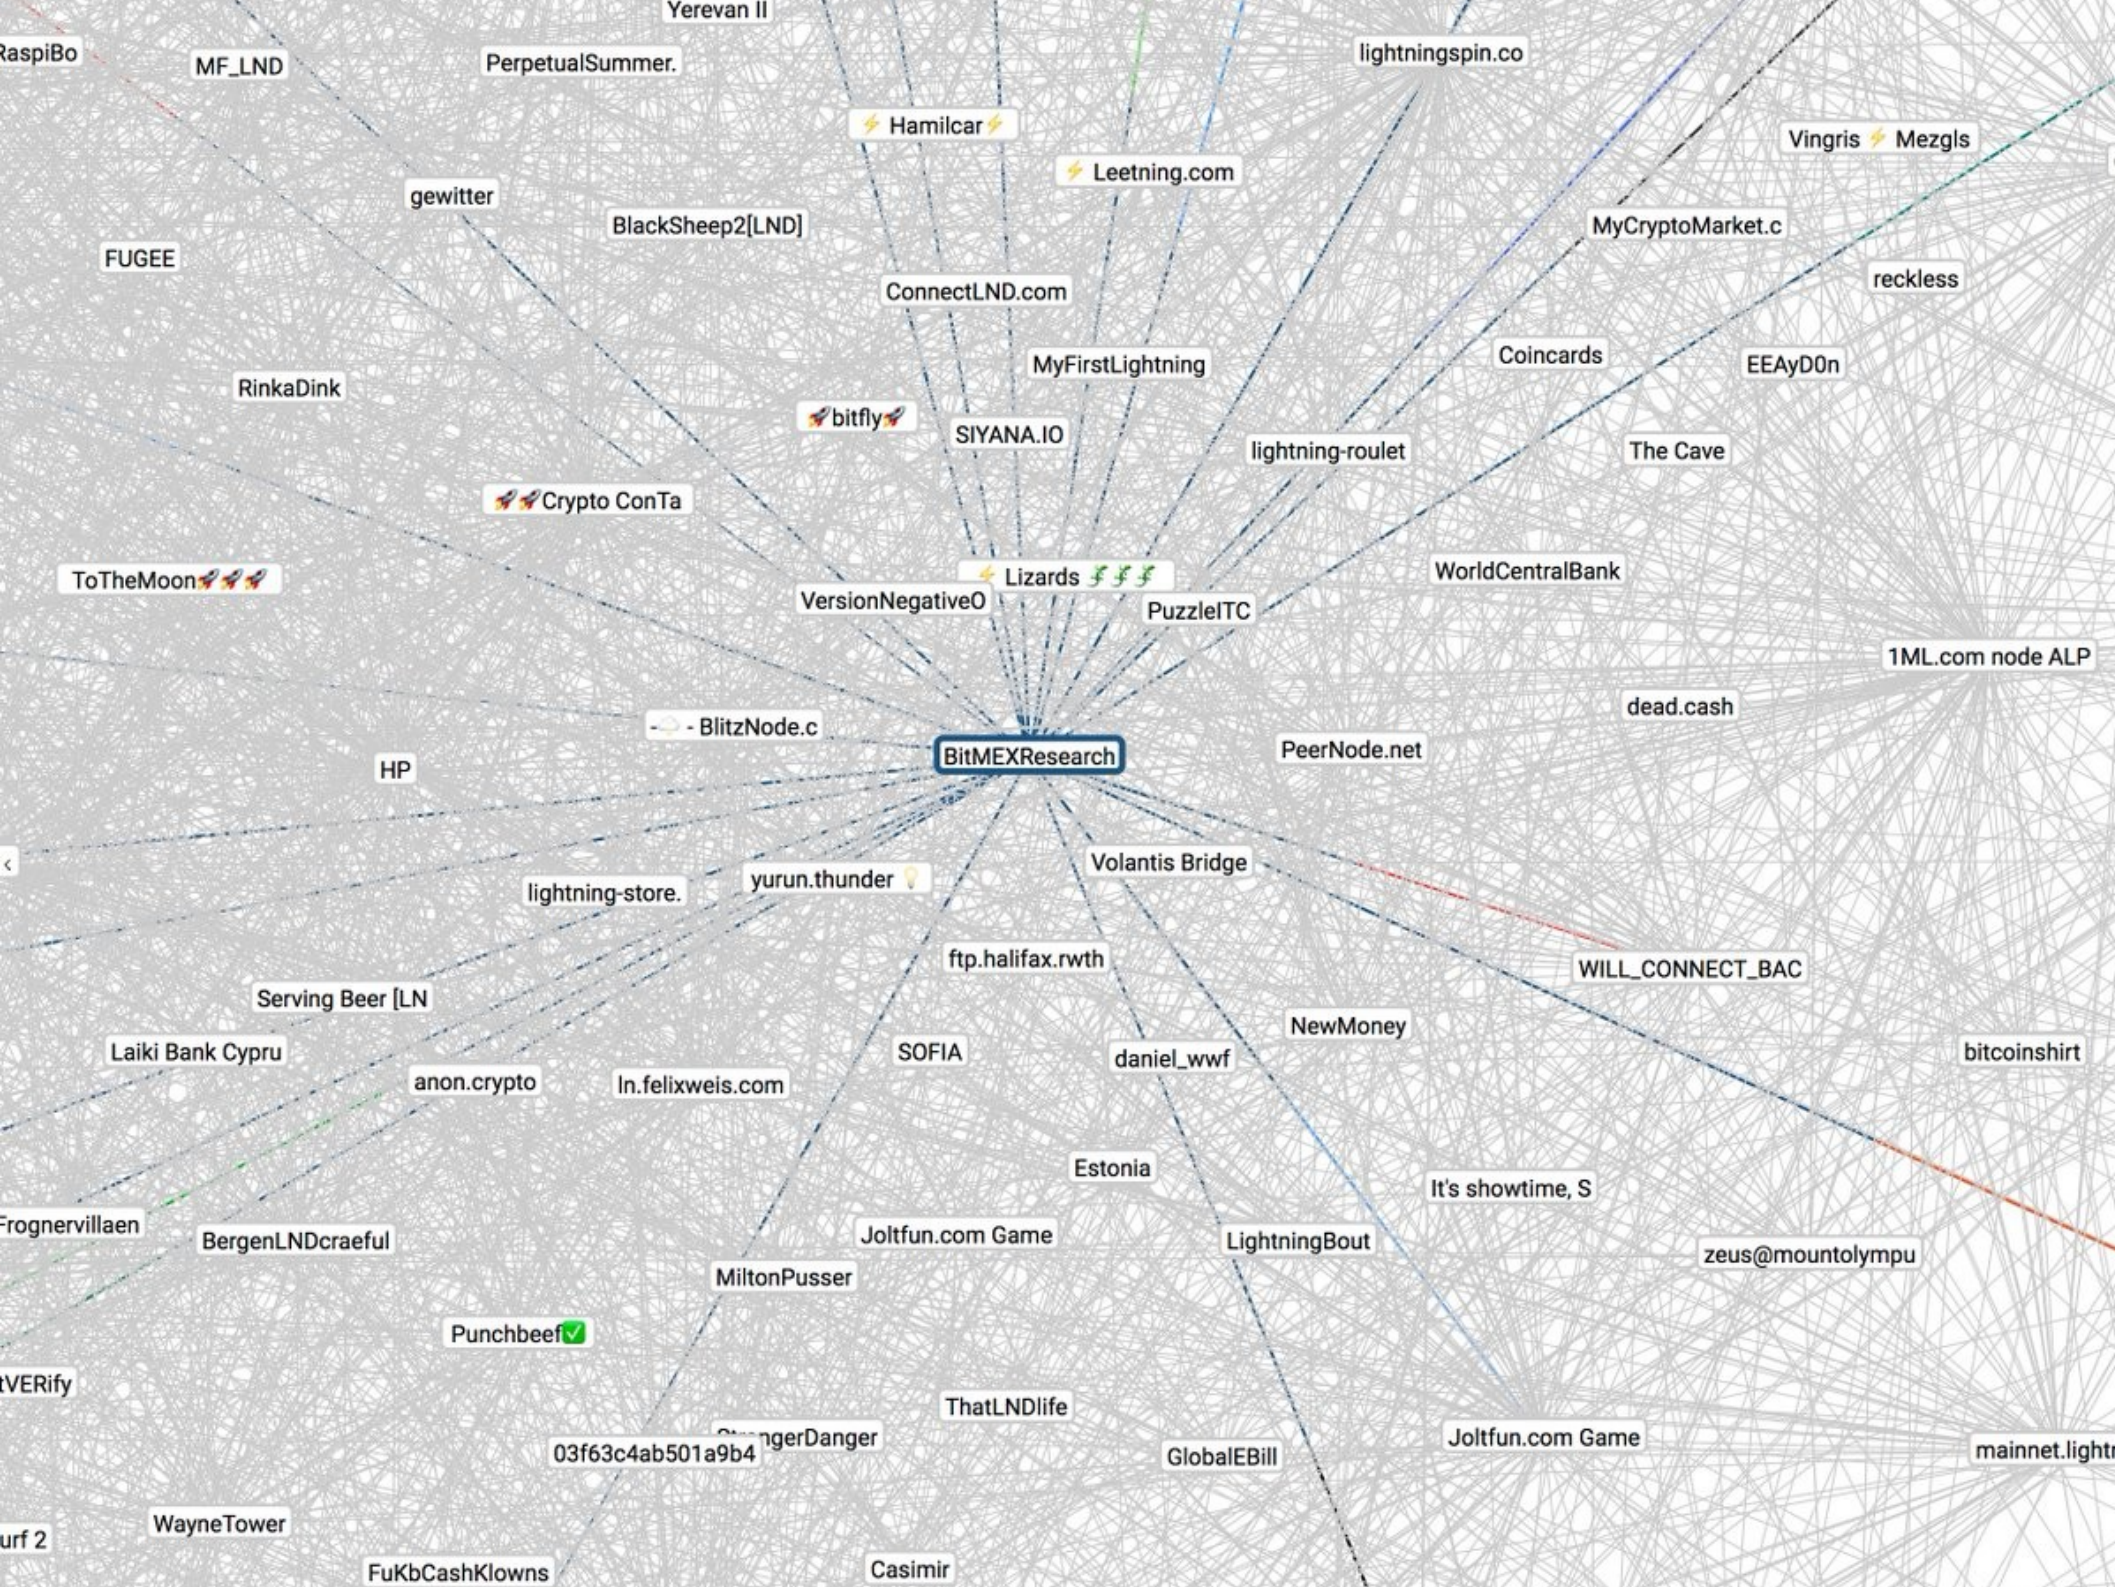

- Hash Time-Locked Contracts (HTLC)
 - Alice sends Bitcoin to a HTLC address
 - Bob only receives the funds if he reveals a secret 'key'
 - Otherwise the payment does not become valid
- Alice → Bob → Carol
 - Carol generates secret key
 - Alice makes payment to Bob dependent on this key
 - Bob makes payment to Carol dependent on the same key
 - Carol needs to reveal her key to receive the payment
- The transfer is made atomically. Either it succeeds completely, or it never happens

A Network of Channels

A Network of Channels

Benefits

- Infinite payments within the network
- Payments can be arbitrarily small (<1 Satoshi)
- **Instant** Payments
- Based on invoices, not addresses
- Easier to protect the users' privacy, as payments aren't public
- Unicast und Anycast are easier to scale
- Bitcoin can be liquidated in real-time

Limitations

- **Liquidity** of the channels is limited
- Finding routes can be complicated
- Participants have to **always be online**
- Channels cannot be opened and closed frequently (Bitcoin ~7 tx/s)

Demos

- **Lightning Roulette**
 - Roulette with Micropayments
- **LND Work**
 - Automatic Turk
- **Y'all's**
 - Paywall for articles
- **Bitcoin.org.hk**
 - Generic payment

Applications

- Efficient market for **microservices**
 - APIs (e.g. Time tables, ticket sales)
 - AI (e.g. Routing, image recognition)
 - Sensors (e.g. Traffic, weather)
 - Computing power (e.g. CGI animations)
 - Memory (z.B. Amazon S3)
- **No Accounts** necessary
 - Security
 - Privacy
 - Identification through asymmetric keys
